

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	October 3, 2026
Team ID	
Project Name	Automated Network Request Management System
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. Prioritizing volume over value, out-of-the-box ideas are welcome and built upon, and all participants are encouraged to collaborate, helping each other develop a rich amount of creative solutions.

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Define Your Problem Statement (How Might We)

"How might we automate and streamline enterprise network provisioning requests to eliminate manual delays, enforce form-level data validation upon submission, and ensure transparent tracking and approval workflows?"

The proposed system will use ServiceNow to automate network provisioning requests, improve data quality through form validation, route requests for approval, and provide transparent tracking throughout the request lifecycle.

Step-2: Brainstorm, Idea Listing and Grouping

Group 1: Form Design & Client-Side Validation

- Create a dedicated Service Catalog item (Network Request) on the ServiceNow platform.
- Implement Catalog UI Policies to dynamically control field visibility based on user selections.
- Enforce mandatory inputs where required.
- Block invalid or incomplete submissions before workflow execution.
- Ensure high-quality and accurate request data.

Group 2: Backend Data Architecture

- Store all submitted catalog request data in a custom database table (u_database_tables).
- Configure auto-numbering with the DAT prefix, for example DAT0001004.
- Map catalog variables directly to custom table fields.
- Requested For, Mobile Number, Customer Address, Type of Connection, Mode of Payment, and Total Amount.
- Maintain submitted request information in a structured backend table for tracking.

Group 3: Workflow Automation & Notifications

- Build an automated workflow in Workflow Studio / Flow Designer triggered on catalog item submission.
- Use Get Catalog Variables to extract request inputs automatically.
- Implement an Ask for Approval step routed to designated managers/approvers.
- Update the request according to the approval decision.
- Trigger dynamic email notifications using the ServiceNow Email Engine (sys_email).
- Use dynamic data pills in notifications, such as: Request REQ0010003 was approved.

Step-3: Idea Prioritization

The ideas are prioritized using importance and feasibility. Core ServiceNow features required for the network request workflow are treated as high-priority items, while external infrastructure integration is kept as future scope.

Idea / Solution Module	Feasibility (X-Axis)	Importance (Y-Axis)	Priority Level
Service Catalog Item + UI Policies	High	High	High Priority / Must-Have
Flow Designer Automation & Approval Logic	High	High	High Priority / Must-Have
Custom Table Mapping (u_database_tables)	High	High	High Priority / Must-Have
Dynamic Email Notifications (sys_email)	High	Medium-High	High Priority
External Third-Party Infrastructure API	Low	Medium	Future Scope

Top Right — High Priority / Must-Have

Service Catalog Item + UI Policies: Essential for collecting valid network request information and preventing incomplete submissions.

Flow Designer Automation & Approval Logic: Essential for automating request processing and approval.

Custom Table Mapping: Provides structured storage and tracking of submitted network requests.

Dynamic Email Notifications: Keeps users informed about request status and approval outcomes.

Bottom Left — Future Scope

External Third-Party Infrastructure API: Integration with external network infrastructure can be considered after the core ServiceNow workflow is implemented.

Final Project Idea: The Automated Network Request Management System will use ServiceNow to automate the complete network provisioning request process—from request submission and validation to backend data storage, automated approval, notification, and transparent tracking.
